

MAD 1 -Project Report

Student Details:

Name: S. Krishna Subramanian

Roll Number: 23f1000655

Student Email: 23f1000655@ds.study.iitm.ac.in

Level: Diploma level

Project Details:

Project Statement: **Household Services Application**

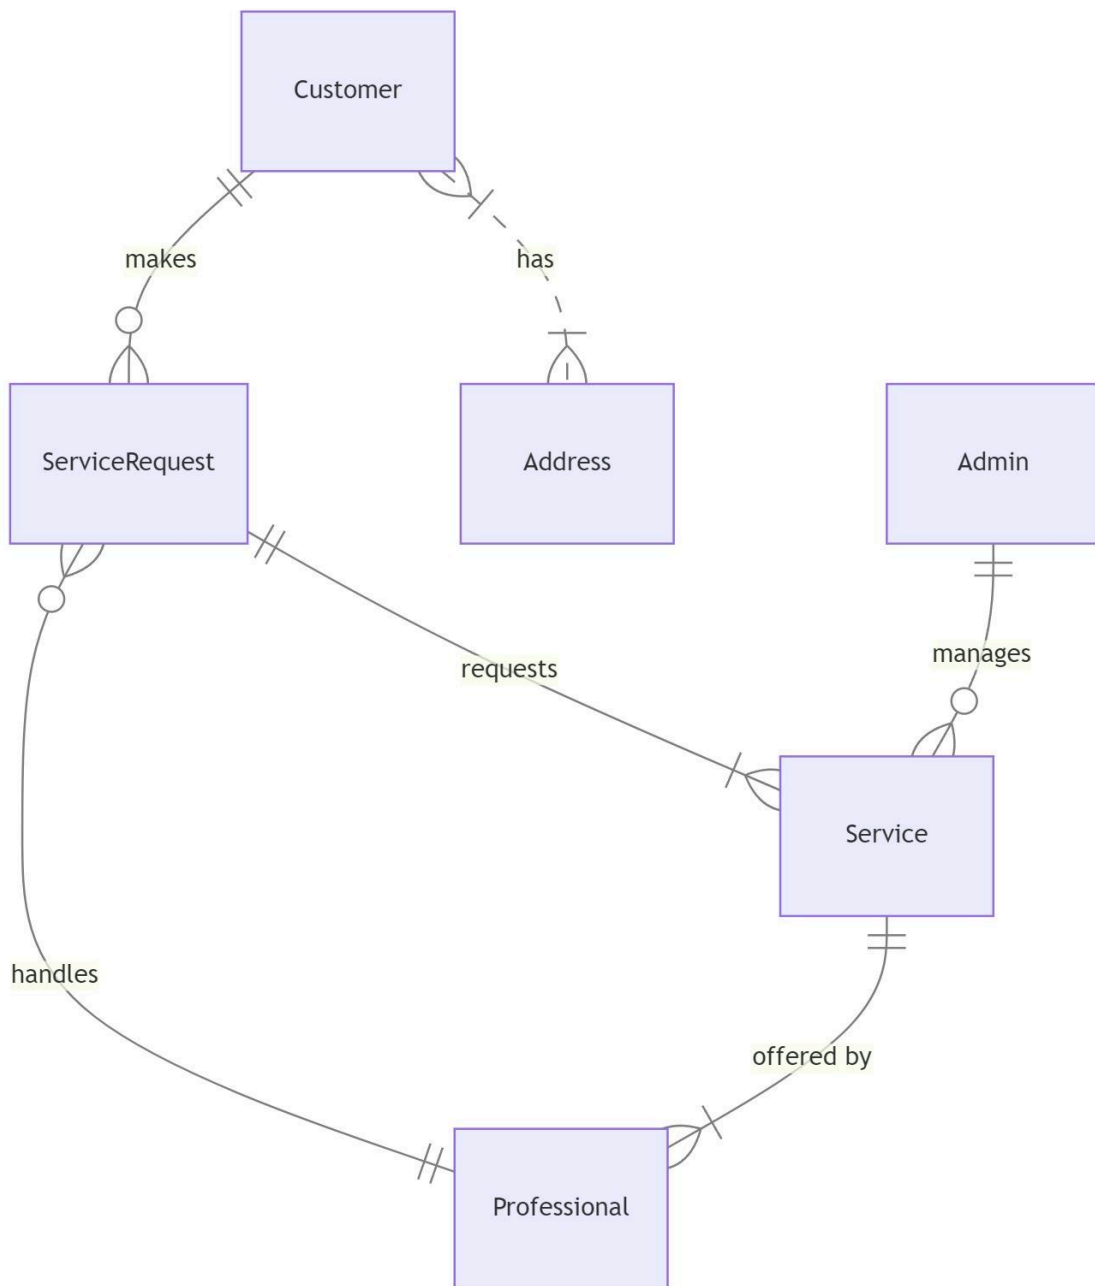

Project Description: It is a multi-user app (requires one admin and other service professionals/ customers) which acts as a platform for providing comprehensive home servicing and solutions.

How I approached the Project Statement: At first, I read the whole project statement of the project and then first made the login portion of the project ready, and after that I made the database connection and the models.py file and linked my app.py file to it. After getting the database done, I started making the dashboards, making the html pages one by one for each and every page of every page for all admin, professional and customer dashboards. I used the help of the wireframe from the Project Statement document to plan my html pages and took help of ChatGPT to style my html pages and conquer my errors. I also created all the necessary app routes in the app.py file. And combining everything, I got this project ready to submit after doing some app testing to ensure all the core properties are satisfied.

Frameworks & Libraries used:

- **Flask** to run the application
- **Werkzeug.security** for creating and checking password_hash
- **Werkzeug.utils** for getting filename securely
- **Jinja** for using loops and variables inside html files
- **Matplotlib** for creating pie and bar charts
- **SqlAlchemy** for connecting the database with the application
- **CSS** for styling my html pages
- **Datetime** library to get date and time
- **OS** library to connect my computer to the application
- **IO** and **base64** libraries to generate the graphs and charts
